CSCI 131 — Introduction to Programming in Python
Programming Assignment 9
Writing Functions

There are no starter files. Open IDLE, choose **File** → **New File** for each program, and save it under the name given in the problem. Put your name in a comment on the first line of each file.

Every program in this assignment has the same layout: a function definition at the top, and the calls given in the problem underneath.

Problem 1 — Spell It Out

Write a function `spell(word)` which prints the word in capital letters with a dash between each pair of letters. Save it as `spell.py`.

At the bottom of your file, call it like this:

```
spell('cat')
spell('Python')
```

Your program must print these lines, one for each call:

Call	Output
`spell('cat')`	`C-A-T`
`spell('Python')`	`P-Y-T-H-O-N`

There is no dash before the first letter or after the last one.

Problem 2 — Letter Count

Write a function `count_letter(word, letter)` which counts how many times `letter` appears in `word`, and prints the answer as a sentence. Save it as `letters.py`.

At the bottom of your file, call it like this:

```
count_letter('banana', 'a')
count_letter('Mississippi', 's')
count_letter('Banana', 'b')
```

Your program must print these lines, one for each call:

Call	Output
`count_letter('banana', 'a')`	`a appears 3 times in banana`
`count_letter('Mississippi', 's')`	`s appears 4 times in Mississippi`
`count_letter('Banana', 'b')`	`b appears 0 times in Banana`

Capitals count as different letters, so there is no `'b'` in `'Banana'`: the only `B` is a capital.

Submission

Submit your source files (`.py`) on Canvas by the end of the period. Put your name in a comment at the top of each file. If a classmate helped you, put their name in the comment as well.

If you are not finished when the period ends, submit what you have — a partial program earns partial credit, an empty one earns none. You may then complete it on your own and resubmit by Sunday, November 1 at 11:59 pm for up to 50% of the remaining credit.
